Summary

AI Engineer specializing in agentic AI workflows, retrieval-augmented generation, and scalable ML systems. Developed automated agents that cut HR coordination time by 80% and cost-analysis processes by 50%, and built RAG-enabled conversational interfaces. Skilled in Python, FastAPI, Ray, Kubernetes, and cloud platforms (AWS, Google Cloud), with hands-on experience integrating foundation models into production.

EDUCATION

Sage University Indore | *Bachelors of Technology in AI* (GPA: 8.4)

Indore, M.P

Alpine Academy | *Higher Secondary* (GPA: 80%)

Indore

EXPERIENCE

Webflow | *Agentic AI Engineer*

Nov 2025 - Present

- **Designed and deployed an automated Recruiting Agent** leveraging AWS Bedrock Agent Core and Strands, which integrated Greenhouse candidate links, Airtable interviewer data, and Google Calendar availability to provide instant scheduling responses in Slack, reducing HR coordination time by approximately **80%**.
- **Engineered a cost-analysis AI Agent** using Ray.IO workflows, gRPC communication, and Google Cloud Pub/Sub event streaming to calculate variances between forecasted and actual IT budgets, achieving a **50% reduction in manual effort** while enabling real-time financial insights.
- **Implemented Retrieval-Augmented Generation (RAG) capabilities** within Slack using Qdrant vector search and LlamaIndex, allowing the AI Agent to answer queries conversationally based on structured data from databases and Google Sheets, transforming static records into an interactive, chatbot-like knowledge system.

Horeca Store | *AI Developer*

Mar 2025 - Oct 2025

- Developed and deployed a bulk order recommendation system as a Kubernetes-orchestrated FastAPI microservice using customer purchase history, product categories, and seasonal trends to optimize B2B order volumes and inventory planning.
- Collaborated cross-functionally with product and engineering teams to integrate AI-driven recommendations seamlessly into the Horeca Store platform, improving client retention and upsell opportunities.
- Researched and implemented advanced machine learning techniques (e.g., collaborative filtering, RAG pipelines leveraging Sentence-Transformers) to power various personalization, forecasting, and decision-support features across the platform.

SETV Global | *AI-ML Engineer*

Jul 2024 - Feb 2025

- Implemented advanced computer vision techniques with CNN models to accurately detect tumors and Alzheimer's in MRI scans, significantly improving diagnostic outcomes.
- Generated detailed diagnostic reports on brain diseases and third-trimester pregnancy complications by identifying key abnormalities with YOLO, PyTorch, TensorFlow, and OpenCV, helping clinicians make faster and more accurate treatment decisions.
- Applied NLP techniques using Anthropic APIs to analyze physicians' inputs, enhancing system understanding and boosting response accuracy by 20%. This helped identifying diseases a lot easier, fast and accurate saving doctor's time.

Codsoft Infotech | *AI and Data Science Intern*

May 2024 - Jul 2024

- Created OCR system for understanding text from any image whether typed or handwritten and store it in the database. Used it to digitalize handwritten assignments and books.
- Developed automated ETL pipelines for structured and unstructured data, reducing data processing time and improving data accuracy for analysis

Devaditya Technocrats LLP | *Operations and Data Analyst*

May 2023 - May 2024

- Designed and developed interactive dashboards and analytical reports with Matplotlib and Pandas, visualizing inventory turnover, financial performance, and customer engagement trends, which enabled managers to make faster data-driven decisions
- Led comprehensive data analysis initiatives using Python (Pandas, NumPy) and SQL, exploring historical financial records, vendor transactions, and operational KPIs to uncover inefficiencies and opportunities for optimization.
- Oversaw end-to-end data operations, including accurate data entry from legacy systems, creation of financial forecasting models in Excel (leveraging complex formulas, pivot tables, and automation tools), and documentation standardization.

SKILLS

- **Programming Languages:** Python, C++, Javascript, C, HTML, CSS, R, Scala
- **Libraries/ FRAMEWORKS:** Scikit-Learn, Numpy, Pandas, PyTorch, Keras, TensorFlow, Hugging Face, scipy, NLTK, Spacy, CNN, RNN, NLP, LLM, Computer Vision, YOLO, Machine Learning, Deep Learning, PySpark, MATLAB, MERN Stack, Tailwind CSS, BeautifulSoup, ReactJS, Matplotlib, RAG, Generative AI, Fine tuning LLMs, LlamaIndex, LangGraph, SmolAgent, Instructor, Anthropic, OpenAI, Qdrant, ParadeDB, Sentence-Transformers, Ray.IO
- **Tools / Platforms:** Git, Github, VS Code, ChatGPT, API, Restful API's, FAST APIs, Figma, n8n, Jira, Jenkins, Kubernetes, Google Cloud Pub/Sub, GRPC
- **Databases:** SQL, MongoDB, MySQL, AWS, Google Cloud, Azure

PROJECTS / OPEN-SOURCE

Document Chat Application using RAG | [Link](#)

- Developed an AI-powered RAG-based Chatbot using LangChain, LlamaIndex, and OpenAI APIs, enabling efficient retrieval-augmented generation (RAG) for answering document-based queries.
- Implemented a vector database (ChromaDB) to store and retrieve document embeddings, optimizing search accuracy and response relevance.
- Built a scalable web interface using Streamlit, integrating user authentication and seamless document upload for interactive AI-driven conversations.

AI Recommendation System | [Link](#)

- Built a modular AI Recommendation System leveraging collaborative filtering and content-based techniques to deliver personalized product suggestions across diverse user profiles and behaviors.
- Integrated Python-based data pipelines and machine learning models to process user interaction logs and product metadata, improving recommendation accuracy and relevance.
- Designed a scalable architecture using Flask for API deployment and ensured real-time response handling for seamless integration into eCommerce or SaaS environments.

Fetus Location and Organ Detection | [Link](#)

- Designed an object detection pipeline to identify fetal organs using YOLOv8 and Roboflow datasets.
- Developed an automated data handling system to manage empty label files and organize training data efficiently.
- Optimized the detection model's performance using Ultralytics and OpenCV, enhancing accuracy and reducing misclassification.

Data Extraction and Sentiment Analysis | [Link](#)

- Automated Web Data Retrieval: Developed a Python-based tool using BeautifulSoup to extract and process article text from multiple URLs.
- Sentiment Analysis Integration: Implemented TextBlob for sentiment analysis, computing polarity and subjectivity scores from extracted content.
- Data Processing & Storage: Structured extracted data using Pandas, saved results in Excel format, and optimized text cleaning with regex-based preprocessing.
